peptide, a peptide).
                 The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal
                                                                                                                                                                                          New PRO polypeptide useful for treating peripheral neuropathy, or neuropathies associated with systemic disease such as post-polio or acquired immunodeficiency syndrome-associated syndrome.
                                                                                                                                                                                                                                                                                                                                                  Kljavin
                                                                                                                                                                                                                                                                                                                                                                      Goddard

RESULT 2296 ADF40964 밁 Ś CC polypeptide in a sample suspected of containing PRO493 polypeptide. CC Similarly, PRO493 polypeptide is useful for detecting PRO337 CC Similarly, PRO493 polypeptide is useful for detecting PRO337 CC polypeptide. PRO700 or PRO735 polypeptide is useful for detecting PRO355 polypeptide, and PRO1559 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4939 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive concent is the toxin, radiolable, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a cc bioactive molecule to a cell expressing PRO4939 polypeptide; PRO775, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO4939 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4939 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide, where the cell expressing PRO337 polypeptide is useful for modulating the cell expressing PRO337 polypeptide is useful for modulating the CC polypeptide; PRO4939 polypeptide is useful for modulating the CC polypeptide; and PRO337 polypeptide is useful for modulating the polypeptide; PRO725, cc polypeptide; and PRO337 polypeptide is useful for modulating the cell expressing PRO337 polypeptide; PRO725, anti-PRO700 or anti-PRO725, cc polypeptide; and PRO359 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO739 polypeptide; PRO725, anti-PRO700 or anti-PRO739 polypeptide; problems, articular cartilage defects, costcoarthritis or rheumatoid arthritis, wound healing and hearing loss in gene amplification in certain tumour cell lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CC comprising the vector and producing PRO, a chimaeric molecule comprising CC propertide in a sample suspected of containing PRO493 polypeptide. Si useful for detecting a PRO493 CC Similarly, PRO493 polypeptide is useful for detecting PRO337 CC Similarly, PRO493 polypeptide is useful for detecting PRO337 CC polypeptide, and PRO359 polypeptide is useful for detecting PRO379 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting CC PRO559 polypeptide, and PRO459 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739 PRO493 polypeptide is useful for linking a CC process death of the cell expressing PRO493 polypeptide. PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide is useful for modulating a bioactive molecule to a cell expressing PRO493.

CC polypeptide is useful for modulating a bioactive molecule or anti-PRO493 polypeptide pRO725, CC pRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 polypeptide. PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide; pRO725, PRO700 or PRO739 polypeptide or anti-PRO493 polypeptide; pRO725, CC prof700 or PRO739 polypeptide or anti-PRO493 polypeptide; pRO725, PRO700 or PRO739 polypeptide or anti-PRO493 polypeptide. PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide. PRO755 prof70 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide is useful for modulating the bio
                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell
                                                                                                                    New secreted and transmembrane nucleic acid useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome, or cancer.
                                                                                                Example
                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                     Ashkenazi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-APR-1998;

ccomprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO contribody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Reports, pro739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. The bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule is causes death of the cell. PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO499 polypeptide; and PRO725, PRO700 or PRO739 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO499 polypeptide; and PRO1559 polypeptide is useful for linking a bloactive molecule for linking a bloactive molecule for a cell expressing PRO799 polypeptide are useful for linking a bloactive molecule for pro799 polypeptide is useful for modulating the cell expressing PRO725, cell expressing PRO739 polypeptide is useful for modulating the cell expressing PRO739 polypeptide or anti-PRO337 polypeptide is useful for modulating the cell expressing PRO739 polypeptide or anti-PRO739 polypeptide or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, cell expressing PRO739 polypeptide or anti-PRO739 polypeptide or anti-PRO739 polypeptide or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO755 polypeptide. The cell expressing PRO755 polypeptide or anti-PRO739 pol

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimacric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence ident to an amino acid sequence chosen from 94 fully defined sequences as in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated speptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host ceicomprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO.
                                                                                                                                                                                                                                                                                                                    Novel PRO polypeptides useful neuropathies associated with sor AIDS-associated syndrome.
                                                                                                                                                                                                                                                              Example 114; SEQ ID NO 573; 465pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                        2004-021571/02

PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337

## WPI; 2004-021572/02.

New nucleic acid encoded a secreted and transmembrane polypeptide, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia or

Example 114; SEQ ID NO 573; 456pp; English.

CC transmembrane protein) having at least 80% and sequence identity
CC to an amino acid sequence chosen from 94 fully defined sequences as given
CC in the specification (including PRO lacking its associated signal
CC peptide, a PRO extracellular domain with or without its associated signal
CC peptide). Also included are nucleic acids encoding the PRO proteins
CC mentioned above, a vector comprising a PRO nucleic acid), a host cell
CC comprising the vector and producing PRO, a chimaeric molecule comprising
CC PRO fused to a heterologous amino acid sequence, and an anti-PRO
CC antibody. PRO337 polypeptide is useful for detecting a PRO4993
CC polypeptide in a sample suspected of containing PRO4993 polypeptide.
CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting
CC PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting
CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a
CC bioactive molecule to a cell expressing PRO337 polypeptide.
CC causes death of the cell. PRO337 polypeptide is useful for linking a
CC consective molecule to a cell expressing PRO4993 polypeptide; PRO725,
CC PRO700 or PRO739 polypeptide are useful for linking a
CC bioactive molecule to a cell expressing PRO4993 polypeptide is
CC causes death of the cell. PRO337 polypeptide is useful for linking a
CC consective molecule to a cell expressing PRO4993 polypeptide; PRO725,
CC PRO700 or PRO739 polypeptide are useful for linking a
CC useful for linking a bioactive molecule
CC useful for modulating at least one biological activity of
CC polypeptide is useful for modulating at least one biological activity of
CC polypeptide is useful for modulating at least o The invention relates to an isolated PRO polypeptide (secreted

The polypeptides are useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence is a Tagman PCR probe used investigate PRO gene amplification in certain tumour cell lines.

PRO4939 polypeptide; and PRO1559 polypeptide is consecutive molecule to a cell expressing PRO725, PRO700 or PRO739 polypeptide. PRO4939 polypeptide or anti-PRO337 cc polypeptide is useful for modulating at least one biological activity of the cell expressing PRO493 polypeptide is useful for modulating the cell expressing PRO4937 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide is useful for modulating the biological activity. FRO750 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO700 or PRO739 polypeptide or anti-PRO1559 polypeptide or anti-PRO755, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or anti-PRO755, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO755, anti-PRO700 or anti-PRO750 polypeptides are useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, ose costathritis or rheumatoid arthritis, wound healing and hearing loss in costeoarthritis or rheumatoid arthritis, wound healing and hearing loss in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide.
New genes and encoded secreted and transmembrane polypeptides, treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia
                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; PCR; secreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sporter related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding a secreted and transmembrane polypeptide, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia,

The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequence as given (CC in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the properties of included are nucleic acids encoding the properties of comprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO (CC polypeptide in a sample suspected of containing PRO493) polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO37 (CC polypeptide in a sample suspected of containing PRO493 polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO37 (CC polypeptide). PRO700 or PRO739. PRO700 or PRO739 polypeptide is useful for detecting PRO375, PRO700 or PRO739. PRO493 polypeptide is useful for detecting PRO493 polypeptide. The bloactive molecule to a cell expressing PRO493 polypeptide. The bloactive molecule is the coxin, radiolabel, or an antibody. The bloactive molecule is coactive molecule is the coxin, radiolabel, or an antibody. The bloactive molecule is coactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO493 polypeptide is useful for molecule to a cell expressing PRO725, CC pro700 or PRO739 polypeptide. PRO493 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO493 polypeptide is useful for modulating the biological activity of polypeptide or anti-PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the profile is a transcript profile. The present sequence is a Tamman PCR probe used investidate PRO or reports and prostidate PRO or receivable profil

08-MAR-1999;
10-MAR-1999;
The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. Similarly, PRO4933 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                            Ferrara

CC bioactive molecule to a cell expressing PRO493 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO1559 polypeptide; and PRO1559 polypeptide is CC useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide, where the cell is killed PRO337 CC polypeptide or anti-PRO4993 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 PRO739 polypeptide or an anti-PRO1559 polypeptide; PRO735, CC PRO700 or PRO739 polypeptide or an anti-PRO1559 polypeptide; and PRO1559 polypeptide; and PRO1559 polypeptide; and PRO1559 polypeptide; and PRO755, pro700 or PRO739 polypeptide or anni-PRO725, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO700 or PRO739 polypeptide. The CC polypeptides are useful for inhibiting tumour growth, retinal disorders, CC sports-related joint problems, articular cartilage defects, CC secoarthritis or rheumatoid arthritis, wound healing and hearing loss in CC mammals. The present sequence is a Tagman PCR probe used investigate PRO gene amplification in certain tumour cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting PRO1559, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            weight m

Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody, PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.

CC transmembrane protein) having at least 80% amino acid sequence identity con a manno acid sequence chosen from 94 fully defined sequence identity con the specification (including PRO lacking its associated signal peptide). Also included are nucleic acid encoding the PRO proteins comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising CC palypeptide is useful for detecting a PRO493 polypeptide. PRO703 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for inking a bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO359 polypeptide. PRO725, pro700 or PRO739 polypeptide pro8337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule or a cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide is useful for modulating the pro725, pro700 or PRO739 polypeptide is useful for modulating the pro725, pro700 or modulating the pro725, pro700 or modulating the biological activity of the cell expressing PRO359 polypeptide. The pro700 or pro739 polypep

CC transmembrane protein) having at least 80% amino acid sequence as given in the specification (including PRO) lacking its associated signal compiled, a pRO extracellular domain with or without its associated signal compiled. Also included are nucleic acids encoding the pRO proteins comprising the vector comprising PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO cc palypeptide in a sample suspected of containing PRO493 polypeptide. PRO715, PRO700 or PRO739 polypeptide is useful for detecting a PRO337 cc polypeptide. PRO715, PRO700 or PRO739 polypeptide is useful for detecting PRO337 cc profits polypeptide. PRO739. PRO493 polypeptide is useful for linking a cc molecule is the toxin, radiolabel, or an antibody. The bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule to a cell expressing PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide. PRO725, Cc pRO700 or PRO739 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bloactive molecule constituted is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide is polypeptide is collypeptide. PRO725, Cc pRO700 or PRO739 polypeptide. PRO493 polypeptide; pRO725, Cc pRO700 or PRO739 polypeptide. PRO493 polypeptide or anti-PRO337 cc polypeptide or anti-PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for profits. PRO337 cc polypeptide or anti-PRO337 polypeptide is useful for profits. PRO337 cc profits a cetivity of the cell expressing pRO339 polypeptide is useful for modulating the biological activity of the cell expressing PRO359 polypeptide is useful for modulating the useful for modulating the biological activity of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   15-APR-1998;

The polypeptides are useful for inhibiting tumour growth, retinal disorders sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing loss mammals. The present sequence is a Tagman PCR probe used investigate PR gene amplification in certain tumour cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; BS; PCR; secreted protein; transmembrane protein; PRO; cytostatic ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; probe; in situ hybridisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PRO
```

```
CC transmembrane protein) having at least 80% amino acid sequence dentity
CC in the specification (including PRO lacking its associated signal
CC peptide, a PRO extracellular domain with or without its associated signal
CC peptide, Also included are nucleic acids encoding the PRO proteins
CC mentioned above, a vector comprising a PRO nucleic acid), a host cell
CC comprising the vector and producing PRO, a chimaeric molecule comprising
CC PRO fused to a heterologous amino acid sequence, and an anti-PRO
CC antibody. PRO337 polypeptide is useful for detecting a PRO493
CC Similarly, PRO493 polypeptide is useful for detecting a PRO493
CC Similarly, PRO705, PRO700 or PRO739 polypeptide is useful for detecting
CC PRO725, PRO700 or PRO739. PRO4933 polypeptide is useful for detecting
CC PRO725, PRO700 or PRO739. PRO4933 polypeptide is useful for linking a
CC bloactive molecule to a cell expressing PRO493 polypeptide. The bloactive
CC causes death of the cell. PRO337 polypeptide is useful for linking a
CC PRO700 or PRO739 polypeptide is useful for rinking a
CC PRO700 or PRO739 polypeptide is useful for rinking a
CC PRO700 or PRO739 polypeptide is useful for rinking a
CC PRO700 or PRO739 polypeptide is useful for rinking a
CC polypeptide or a cell expressing PRO493 polypeptide is useful for rinking a
CC polypeptide or PRO739 polypeptide is useful for rinking a
CC polypeptide or PRO739 polypeptide, and PRO1559 polypeptide is
CC polypeptide or polypeptide. PRO493 polypeptide is useful for modulating the bloogical activity of the cell expressing PRO337
CC polypeptide or anti-PRO337 polypeptide, where the cell is killed. PRO337
CC polypeptide or anti-PRO337 polypeptide is useful for modulating the bloogical activity of the cell expressing PRO599 polypeptide is useful for modulating the properiod is useful for properiod in the properio

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                08-MAR-1999;

CC Similarly, PRO4993 polypeptide is useful for detecting PRO337 CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO155, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a CC pro700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO725, CC pro700 or PRO739 polypeptide. PRO493 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide is useful for modulating the pro725, pro700 or PRO739 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, pro700 or PRO739 polypeptide or anti-PRO4993 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, pro700 or PRO739 polypeptide or anti-PRO725, anti-PRO739 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide. The professing PRO725, PRO700 or PRO739 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide. The professing PRO559 polypeptide or anti-PRO725, anti-PRO700 or anti-PRO739 polypeptide or anti-PRO739 polypeptide. The professing PRO559 polypeptide or anti-PRO739 polypeptide. The professing PRO559 polypeptide or anti-PRO739 polypeptide. The professing PRO550 polypeptide or anti-PRO739 polypeptide. The professing PRO550 polypeptide or anti-PRO739 polypeptide. The professing PRO550 polypeptide or anti-PRO739 polypeptide. The pro

cc in the specification (including PRO lacking its associated signal cc ipeptide). Also included are mucleic acids encoding the PRO proteins comprising the associated signal compationed above, a vector comprising a PRO mucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising comprising a PRO493 polypeptide is useful for detecting a PRO493 polypeptide. PRO735, PRO700 or PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for detecting PRO355 polypeptide is useful for detecting PRO355 polypeptide. PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for detecting PRO357 polypeptide is useful for detecting PRO357 propeptide. PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for detecting PRO357 polypeptide is useful for PRO555 polypeptide. PRO725, PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide; PRO725, PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO357 polypeptide; PRO725, PRO700 or PRO739 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide; pRO725, PRO700 or PRO739 polypeptide or anti-PRO337 polypeptide; PRO725, PRO700 or PRO739 polypeptide or an anti-PRO339 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide; PRO725, PRO700 or PRO739 polypeptide or an anti-PRO339 polypeptide; pRO725, PRO700 or PRO739 polypeptide; PRO725, PRO700

HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopy codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromesome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potental therapeutic agents for manner in from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30-JAN-2001;

Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as lekaemias, lymphomas and cancers such as cancer of the brain, second such as those caused by such as lekaemias, lymphomas and cancers such as cancer of the brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Wbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                      The patent discloses a method of screening mammals for autoimmune diseases by identifying polymorphisms in interleukin (IL)-12 p40 gene. The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Thl/Th2 dysregulation in a mammal. They are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is mammalian IL-12 p40 intron 2 allelic variant

pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human cleukocyte adhesion protein p150, 95 alpha subunit gene (HUMINTO2) beginning at nucleotide 2370 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in cliances, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays can o-xyloso dimer synthout subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3' positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer cuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448.
                                                                                                                                                                                                                                                                                                                                                                                                 New oligomers contg. modified bases - doublet in a DNA duplex, for treating herpes malignancy and inflammation.
                                                                                                                                                                                                                                                                                                                       The synthetic oligomer is capable of forming a triplex at physiological

                                                                             Sequence
                                                                                                   Revised record
                                                                                                                     The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotide are because foremaics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                  Claim 68; Page 11; 43pp; English.
                                                                                                                                                                                                                     New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                    WPI; 2001-335945/35.

                                                                                                                                                                                                                                                                                                                                                                                        This invention describes the isolation of novel human polynucleotides encoding glypican-related proteins, glypican-6 (GPC6) and glypican-4 (GPC4). The invention also describes the polynucleotide and encoded protein sequences of glypican-1 (GPC1), glypican-3 (GPC3) and glypican-5 (GPC5). The products of the invention can be used to diagnose and treat disorders and diseases, particularly those involving abnormal cell growth and behaviour, such as somatic overgrowth and tumour formation. AAZ00551-200554 represent primers used in 5'-RACE (rapid amplification of cDNA
                                                                                                                                                                                                                                                                                                                                               Sequence 25 BP; 5 A; 8 C; 5 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                RESULT 2324
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC base, or the complement of the segment. Also described are: (1) an allele CC -specific oligonucleotide that hybridises to a segment of the novelty, (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a concleic acid, comprising obtaining a nucleic acid from an individual, and cotermining a base occupying any one of the polymorphic sites of the convelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to analyse an individuals nucleic acid segments for the presence of polymorphisms. The presence of the phenotype with a particular polymorphism. The presence of polymorphic sites are useful for, e.g. forensics, paternity testing, correlation of polymorphisms with phenotypic traits and for genetic mapping of phenotypic traits. AAA78631 to AAA79632 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                          The invention describes an isolated polypeptide segment (1) whose genes are fat regulated. (I) or the polynucleotide encoding it (II) are useful for diagnosing the presence of or a predisposition for a disorder involving fatty acid regulated genes in a subject. A composition containing (I) or (II) is useful for treating a disorder involving fatty acid regulated genes, where the disorder is selected from a polyunasturated fatty acid (PUPA) disorder, eczema, cardiovascular disorders (such as hypertriglyceridaemia, dyslipidaemia, atherosclerosis, coronary artery disease, cerebrovascular disease or peripheral vascular disease), inflammation (such as sinusitis, asthma, pancreatitis, seconstritis, rheumatoid arthritis or acne), body weight disorders (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, cystic fibrosis, pre-menstrual syndrome, diabetes, and diabetic complications. (I) or (II) is useful as research agent and materials for
                                                                                                                                                                                                                         discovery of treatments and diagnostics for a disease, particularly human disease. (II) is useful for constructing nucleotide probes and primers, for detecting genetic polymorphism, for detecting changes in the level of expression of (II), and as a diagnostic tool. This sequence represents a PCR primer used to isolate DNA encoding fat regulated genes
                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    involving

The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple

                                                                                                                                                                                                                                                                                                                                                           Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                           such as leukaemias, lymphomas and cancers such as cancer of the brain breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                        sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as Hose caused by viruses such as Hose caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain,

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Locus-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defi primer sets, useful for subtyping or typing of HLA Class I alleles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method (MI) for determining a CC toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a CC reference gene expression profile indicative of toxicity, and so CC determining the presence of a toxic response to the agent. Also CC described: (1) an array comprising one or more polymucleotides sclected from the genes corresponding to the partial sequences given in ABZ82842 CC ; and (2) determining if a gene putatively identified to be a toxic CC response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject CC exposing cells to an agent or industrial agent, comprising: (a) CC exposing cells to an agent; (b) obtaining the test gene expression profile for a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or CC comparing the test profile to the expression profile of a gene with a similar function or CC comparing the test profile to other known toxic compounds. The methods are useful for correct out of correct or industrial gene after exposure useful for correct or industrial corrections are useful for correct outer to other known toxic compounds. The methods are useful for correct outer to correct outer and correction or correct outer to the expression profile of a gene with a similar function or correct exposure to other known toxic compounds. The methods are useful for correct outer to other known toxic compounds are useful for correct outer to the expression profile of toxic outer to a known toxic compounds. The methods are useful for toxic outer to other known toxic compounds. The methods are useful for toxic outer to other known toxic compounds. The methods are useful for toxic outer to other known toxic compounds. The methods are defined and chemical corrections and ch

The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein telessification of genes. This can then be used to predict the the sequence and structure, in organ donation to match the organ with the sequence and the can be used the control of the method can be used the control of the method can be used the control of the control of the control of the method can be used the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or g class 1/2 HLA comprises identifying all possible nucleotide specific length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA sequence analysis; sequencing; protein sequence; protein structure; gene typing; organ donation; bacteria identification; 16s rRNA; HLA; human leukocyte antigen; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74322). The present sequence is one such SSR repeat. SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         apolynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ulfendahl P,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
         The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABV/8759 to ABV/8762 and ABB98519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopy codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL Shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                        The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CL Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying billelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 25 BP; 5 A; 13 C; 6
                                                 blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human microarray DNA oligonucleotide SEQ

```
environmentally or developmentally-regulated expression of a target gene (TG) in a plant. The method involves producing a plant from a transformed plant cell comprising TG in operative linkage with a genetic regulatory element, especially Brassica turgor gene-26 (btg-26) promoter element, which directs tissue-specific expression of TG within selected plant tissue. A method (M2) for increasing seed yield or blomass of a plant growing under one or more environmentally adverse conditions or low nitrogen, by transforming a plant with TG in operative linkage with a btg nitrogen involved in nitrogen assimilation or metabolism and growing the transformed plant is also provided. (M1) is useful for directing the supplied to the condition of the conditio
                                                                                                             of the plant, resistance to insects, nematodes, viruses, bacteria or fungi, appearance or antisense genetic sequences, within a fruit, seed, flower, tuber, shoot, vascular system, meristem, pollen or ovule of a plant. (M2) is useful for increasing biomass of a plant growing under one or more environmentally adverse conditions such as salinity, nutrient, drought, temperature, oxygen, heavy metal, pH stress or their combinations. The present sequence represents a fragment of the btg-26
                                                                                                                                                                                                                                                                                                                                                                                specific expression of a target gene encoding proteins involved in phytoremediation, pesticide, herbicide resistance, resistance to stress, structural proteins, pharmaceutical proteins or enzymes which produce pharmaceutical compounds, nutrient uptake or utilization, plant growth, proteins which alter nutrient content or proteins involved in appearance proteins which alter nutrient content or proteins involved in appearance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Directing tissue-specific expression of a target gene in a plant, using a genetic construct comprising a target gene in operative association with Brassica turgor gene-26 promoter element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200155433-A2

The oligonucleotides (ONS) are targeted to either coding region, start or stop signal or 5' or 3' untranslated region (UTR) mENA encoding human c-raf. The ONS may be phosphorothicate linked and may contain modifications at the 2' position of the sugar modety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothicate linked and contain 2'-O-alkyl sugar modifications. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC oligonuclectides (A), which specifically hybridises to RNA or DNA, comprises a linear sequence of nucleotide units linked by phosphodiester or phosphorothicate linkages, comprising a first subsequence having 2'-O-CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-O-CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-O-CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-O-CH3-CH2-CH3 sugar moieties and protein kinase C genes, useful in the therapy of AIDS, atherosclerosis, bacterial or other infections, or to control aberrant cell growth in humans, animals or plants. (A) can also be used diagnostically, particularly when labelled, to detect overexpression of mRNA or expression of abnormal RNA, including imaging of tissue sections, and as a research reagent. (A) has increased binding affinity for complementary strands (attributable to the 2'-O-CH2-CH3 sugar moiety, which overcomes the loss of affinity caused by altered intersugar links), and increased resistance to nuclease (from the modified links and the 2'-O-CH2-CH2-O-CH3 sugar moiety)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Compositions containing the oligonucleotides entrapped in sterically stabilised liposomes are claimed. The compsns. can be used for inhibiting the expression of human raf. They can be used for the treatment of mammalian cancer, partic, thuman cancer e.g. lung, stomach, renal, breast, laryngeal, pancreatic, colorectal cancer and malignant melanoma. In particular the compsns. can inhibit abnormal raf expression and retain anti-hyperproliferative activity after prolonged circulation in the bloodstream. They facilitate the reduction of accumulation of ONs in non-target organs and a reduction of acute and chronic side effects during prolonged treatment. ON18, 19 and 21 are chimeric oligonucleotides with uniform phosphorochioate backbones, and substituted with methoxy at the composition of the sugar moiety as indicated above. ON21 is targeted to the surprocess.
                                                                                                                                                                                                                              Cancer; anionic polysaccharide; human; renal cancer; breast cancer; laryngeal colorectal cancer; malignant melanoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting human raf expression, poligonucleotide targetted to mRNA sterically stabilised liposome(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonucleotide, targeted to human raf encoding mRNA, and an anionic polysaccharide. The present sequence represents a specifically claimed oligonucleotide for use in the composition. The composition can be used to treat mammalian cancer, especially human lung, stomach, renal, breast laryngeal, pancreatic or colorectal cancer, or malignant melanoma. The anionic polysaccharide increases tumour uptake of the oligonucleotide, particularly an oligonucleotide targeted to human raf encoding mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A pharmaceutical composition has been developed comprising oligonucleotide, targeted to human raf encoding mRNA, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition for cancer treatment - oligo:nucleotide targetted to mRNA
                                                                                                                                                                                                                                                                                                                   06-JUN-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nuclease resistant; ribofuranosyl moiety; 2'-aminoalkoxy; tumour; 2'-imidazolylalkoxy; modulation; activity; AIDS; atherosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   c-raf antisense chimeric oligonucleotide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention. Oligonucleotides of the invention are nuclease resistant, and comprise covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and base portion where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence. At least one of the nucleosides indidazolylalkoxy substituent. The nuclease resistant compounds can be used for modulating the activity of DNA or RNA. They can be used for treating organisms having a disease characterised by the undesired production of a protein. Diverse organisms such as bacteria, yeast, protezoa, algae, plant and higher animal forms including warm-blooded animals can be treated in this manner. The compounds can be used for treating e.g. AIDS, atherosclerosis or tumours. They can also be used for diagnostic methods for detecting the presence or absence of abnormal RNA molecules, or abnormal or inappropriate expression of normal RNA molecules in organisms or cells. The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2'-substituent selected from cyano,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf expression. Sequences AAZ11511-537 and AAZ11565-573 represent antisense oligonucleotides for human c-raf kinase
                                                                                                                                                                             Nuclease resistant oligonucleotide analogues - having nucleosides including modified deoxyfuranosyl moiety bearing 2'-substituent to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

The nuclease resistant oilgonucleotides (ONs) can bind to and modulate the activity of DNA or RNA and can be used for treating organisms having a disease characterised by the undesired production of a protein. They can be used in therapeutic or prophylactic treatment in organisms such as bacteria, yeast, protozoa, algae, plant and higher animal forms including warm-blooded animals. The ONs can also be used for treating infections, AIDS, atherosclerosis or tumours. The products can be used for detection and diagnosis. The ONs provide enhanced binding to targets. Increased binding of 2' sugar modified sequence-specific ONs provides superior potency and specificity compared to phosphorus-modified ons. The present sequence represents a chimeric antisense oligo for c-raf
PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAZ36734-X37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as mongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, penempopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR prime: bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                   The present sequence represents a phosphorothicate antisense oligonuclectide used to inhibit c-raf gene expression. The oligonuclectide used to inhibit c-raf gene expression. The oligonuclectide used to indicate oligonuclectide, whereby one part has at least two consecutive 2'-F(2'-H) nuclectides and the second part has at least five consecutive nuclectides with 2'-H sugar moieties. The modified oligonuclectide has increased nuclease resistance, and increased binding affinity for substrates. The oligonuclectide elicits RNase H strand cleavage of specific RNAs. Oligonuclectides of the invention are useful for the diagnosis, detection and treatment of conditions susceptible to oligonuclectide therapeutics (e.g. AIDS and atherosclerosis). (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                    Oligonucleotides eliciting RNAase H activity useful for diagnosis treatment of diseases e.g AIDS or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotide; RNAse H strand cleavage; pl AIDS; atherosclerosis; ss.

                                                                                                                CC comprising 2-fluoro modified ribofuranosyl nucleotides. (I) comprise CC covalently bound nucleotides, where the nucleotides are joined together by: (a) internucleotide linkages such that the base portion of the CC nucleotides forms a mixed base sequence; and (b) at least one of the CC nucleotides includes a modified ribofuranosyl group bearing a 2-fluoro CC substituent; provided that at least two of the nucleotides are 2-fluoro CC modified ribofuranosyl nucleotides when the internucleotide linkages are C phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its CC expression. (I) are resistant to nuclease degradation and hybridise with CC appropriate strength and fidelity to its target RNA/DNA. (I) are also CC useful as research agents, diagnostic agents and as oligonucleotide CC therapeutics. (I) may be used to treat atherosclerosis following CC angioplasty to prevent reocclusion of the treated arteries. (I) may also be used to modulate the expression of RAF gene, a cellular gene whose CC useful at the expression of RAF gene, a cellular gene whose CC activate form has been implicated in abnormal cell proliferation and CC kinase C. (I) exhibit hybridisation proporties of higher quality than CC kinase C. (I) exhibit hybridisation proporties of higher quality than CC sequence represent an oligonucleotide duplexes containing CC methylphosphonates, phosphoramidates and phosphate triesters. The present CC resent invention

                                                                                                                                                                      c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonuclectide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and rafassociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, anglogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  31-MAY-1994;

                                                                                                                The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an angiogenesis or neovascularisation.
                                                                                  Sequence
                                                                                                                                                                                                                                                     Treating cancer, angiogenes antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 therapy; cancer; cytostatic; anti-angiogenic; vascular; antisense; phosphorothioate backbone; c-raf kinase; ss.

05-MAR-1992;
01-JUL-1992;
                        organism with a disease associated with the undesired production of a protetin, e.g. bacterial, viral or protozoan infections, AIDS, abnormal cell proliferation and tumour formation, or atherosclerosis. The press sequence represents the human c-raf mRNA antisense oligonucleotide #7
                                                                         with RNA or DNA, comprising covalently-bound nucleosides that individually include a ribose of deoxyribose sugar portion and a base portion. The nuclease resistant compounds are useful as therapeutics, diagnostic agents, or research reagents. The compounds are also useful for modulating the activity of an RNA or DNA molecule, or for treating for modulating the activity of an RNA or DNA molecule, or for treating
                                                                                                                                                                                                                                                                                              Ç

  The invention relates to a modified oligonuclectide comprising several covalently bound nucleosides including a ribose or deoxyribose sugar covalently bound nucleosides including a ribose or deoxyribose sugar covalently bound a base portion. The nucleosides are joined together by circumstance of the nucleoside includes a conditied ribofurance. At least one of the nucleosides includes a conditied ribofurance, and research agents a 2'-fluoro substituent. The carrier of the nucleosides includes a conditied ribofurance, and research agents e.g. for the treatment of various viruses (e.g. AIDS), for modulating the production of proteins by an organism, concertance of the protein of proteins by an organism, concertance of a protein (e.g. atheroselerosis, cancer), detecting the presence or consence of abnormal RNA molecules, or abnormal or inappropriate consence of abnormal RNA molecules, or abnormal or inappropriate consence of abnormal RNA molecules in organisms or cells, and for the selective binding of RNA for use as research reagents and diagnostic containing of RNA for use as research reagents and diagnostic consents. The compounds have improved stability to enzymatic degradation constitute to bind to a specific DNA or RNA with fidelity compared to wild-consent or the present sequence is an antisense oligonucleotide of the invention targetine bursan capacitic an antisense oligonucleotide of the invention targetine bursan capacitic an antisense oligonucleotide of the invention targetine bursan capacitic an antisense oligonucleotide of the invention targetine bursan capacitic and antisense oligonucleotide of the invention targetine bursan capacitic and antisense oligonucleotide of the invention targetine bursan capacitic and antisense oligonucleotide of the invention targetine bursan capacitic and antisense oligonucleotide of the invention targetine bursan capacitic bursantic and phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      멍

                                                                                                                                                                                                                                                                                       The invention describes a method of preventing or treating tumour metastessis in an animal comprising administering to the animal an oligonucleotide 8-50 nucleotides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human c-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using antisense oligonucleotide modulation of human raf gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tumour metastasis; human; raf; raf expression inhibitor; cytostatic; antiarteriosclerotic; antisense-therapy; hyperproliferative disorder; atherosclerosis; tumour; c-raf kinase; antisense oligonucleotide; ss.

                                                                          oligonuclectides comprising at least one modified 2'-deoxyfuranosyl group. The modified oligonuclectides are disclosed as being useful for modulating the production of a protein by an organism, and especially for treating a disease in an organism which is characterised by the undesired production of a protein. The oligonuclectides may be used to treat diseases caused by viruses or other agents. The oligonuclectides may also be used for disgnostic methods for detecting the presence or absence of abnormal RNA molecules, or for detecting the inappropriate expression of normal RNA molecules in an organism or cell. Oligonuclectides of the invention that selectively bind RNA molecules as research as research reagents. The new oligonuclectides are nuclease resistant and hybridise to RNA or DNA targets with high strength and specificity. The present sequence represents a human c-raf antisense oligonuclectide.
                                                                                                                                                                                                                                                                                                        modified 2'-deoxyfuranosyl group.

                                                                               The invention relates to an oligonucleotide 8-50 nucleotides in length CC which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, comprising a regulatory role in signal transduction, composition comprising the oligonucleotide and a pharmaceutically cacceptable carrier. The antisense oligonucleotide is useful for composition comprising the oligonucleotide and a pharmaceutically contacting the expression of human raf in human cells or tissues, by contacting the expression of human raf in human cells or tissues, by contacting the expression of the seventing a disease or condition associated cuit the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a concevascularisation (preferably ocular angiogenesis or neovascularisation). The oligo. is also useful for inhibiting cample for detecting and determining the role of raf expression in conditions and physiological processes and conditions and for various cell functions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     31-MAY-1994;

14929
to the human or murine acyl coenzyme A cholesterol acyltransferase-1 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human or murine acyl coenzyme A cholesterol acyltransferase-1 RNA, and were analysed for their effect on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase (ACAT) enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-COA, and are also involved in regulating the concentration of cellular free sterols. The murine acyl coenzyme A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 2352
ADF87702
                                           The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in generification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing the single nucleotide gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
